I've been doing some thinking in order to solve a problem and it occurred to me that the sequence  $1 + \frac{1}{n}$  may or may not be monotonically increasing. I thought that the argument was simple but I have come to a dead end. My work for the day is this:  $1 + \frac{1}{n} > 1 + \frac{2}{n} > \dots > 1 + \frac{n}{n} = 1$  Therefore, by the principle of mathematical induction, it is indeed true that  $1 + \frac{1}{n} > 1 + \frac{2}{n} > \dots > 1 + \frac{n}{n}$ . However, there does not seem to be any way to extend that argument to show that  $1 + \frac{1}{n} > \frac{1}{n}$  or, in other words, that  $1 + \frac{1}{n}$  is monotonically increasing. A: We know that  $\lim_{n \rightarrow \infty} (1 + \frac{1}{n}) = 1$ . It seems that you want to show that this sequence is increasing. You can do that if you observe that  $1 + \frac{1}{n} \geq 1 + \frac{1}{2n}$  and thus  $1 + \frac{1}{n} - \frac{1}{2n} = \frac{1}{2n} \geq 0$ .

1. Field of the Invention The present invention relates generally to an electrical connector, and more particularly to a card edge connector mounted on a PCB.

2. Description of Related Arts U.S. Pat. No. 7,022,941 to Charles et al. issued Apr. 4, 2006 discloses a card edge connector. The card edge connector comprises a housing, a plurality of contacts retained in the housing, an insulation body partially covers the contacts, and a frame partially covers the contacts. The insulation body, the frame, and the contacts are molded to form a solid structure. The contact has a connecting portion. The contacts are stamped from a metal strip. Each contact has a contact portion which is stamped from a contact portion of the metal strip. The contact portion is a plate-like structure, and has a receiving cavity. The contact portion has a contact part of contacting with the PCB. A spring is received in the receiving cavity, and the spring abuts against

the PCB. When the PCB is inserted into the housing f988f36e3a
